

Chemistry Internship
Sines/ Portugal
jobcode POR001

The position available would be in one of three main areas: Water/Spectrochemistry, General petroleum work, or in the GC area. We are located within the REPSOL refinery complex and we outsource the laboratory for doing the process analysis as well as third party work for our inspection branch. We also do third party testing of gasoline, diesel, fuel oil and lube oils in the petroleum area and the effluent and process water analysis as well as various chemicals, such as glycerin, caustic soda, and acetic acid in the water section.

It would depend on the candidates' educational level, expectations and on their ultimate career choice, on where they would be placed, but generally the GC area is more complicated and requires a longer period of study. Not impossible but...we test LPG, pygas, butadiene, propylene, ethylene, propane, butane, etc. in there daily. The other two areas could be open for anyone with midlevel knowledge of chemistry or chemical engineering.
